

Before:

```
identifier    ::= (<alpha> | _) (<alpha> | <digit> | _)*
char-lit      ::= '(<char> | \')'
string-lit    ::= "(<char> | \")*"
int-lit       ::= <digit>+
comment       ::= // .* <line-ending>
```

After:

```
identifier    ::= (<alpha> | _) (<alpha> | <digit> | _)*
char-lit      ::= '(<char> | \')'
string-lit    ::= "(<char> | \")*"
int-lit       ::= <digit>+
comment       ::= // .* <line-ending> | // .*\\z
```

The error is that, in order to match a comment, a line ending character is **required**, so if a comment is on the last line of the KXI file, it won't match because there isn't a line ending.

To fix this, I added an alternate match for the comment, where instead of a line ending character, I used '\\z', which "matches the end of a string (but not an internal line)." Effectively, '\\z' matches the end of the file, guaranteeing that nothing will be matched after that, so it's safe to match a comment as long as the line started with '// '.
